About these numbers

The depth of standing water above ground was determined by using the FEMA Provisional Topographic Contours, which show elevation above mean sea level, and the nearest FEMA Coastal High Water Mark (HWM). The Provisional Topographic contours were calculated from LIDAR data collected by EarthData Inc for the National Oceanographic and Atmospheric Administration Coastal Services Center and the State of Mississippi. The data is considered preliminary and has not been verified. Coastal HWM locations were surveyed horizontally in North American Datum of 1983 (NAD 83), State Plane feet, and vertically in North American Vertical Datum of 1988 (NAVD 88), U.S. survey feet. Coastal HWM locations have been surveyed to within accuracies of a quarter-foot vertically and 10 feet horizontally, with a 95 percent confidence level. List created by the City of Biloxi, June 2007.
